

Transponder Installation

The transponder is best installed between 100 to 600 mm from the ground. The best orientation is with the writing on the transponder vertical as shown. Please securely fasten the transponder using the supplied cable ties then cover with duct tape for extra security. Ideally it should be attached to the corflute body, away from any metal work to minimize interference.

At the completion of the race please remove the transponder and return to Timing BEFORE leaving the Track . If you retire early please return the transponder to Timing.

The future use of this system depends on the safe return of all components. Many thanks to the RACV for allowing us to use their timing equipment.

UP

100 to 600 mm from ground
